Rushikesh Surose

Frontend Developer | Computer Engineering Student

rushisurose83@gmail.com | 9309353709 | Pune ,Maharashtra | LinkedIn | GitHub | Portfolio

Summary

Second-year Computer Engineering student focused on frontend development with HTML, CSS, JavaScript and React, backed by Python backend and local-AI experience. Built three full projects, including a React + FastAPI + SQLite app deployed on Vercel, and solve DSA problems daily in C++.

Technical Skills

- **Frontend:** HTML5, CSS3, JavaScript (ES6+), React (learning) — HTML-CSS, Portfolio, CampusFix AI
- **Backend:** Python, FastAPI, Pydantic, REST APIs, SQLite — CampusFix AI
- **Local AI:** Ollama, Llama 3, pypdf — DocuParse Edge
- **DSA / Languages:** C++, Python — DSA-Cpp-Tracker
- **Tools & Deployment:** Git, GitHub, Vite, Vercel, Render

Projects

CampusFix AI — Full-Stack Issue Reporting Platform | GitHub | Live Demo

React 18, Vite, CSS, FastAPI, Pydantic, SQLite, Gemini API

- Built a React + Vite frontend with a report form and an admin dashboard showing issue counts, priority filters and a "Mark resolved" action.
- Developed a FastAPI backend with 5 REST endpoints and Pydantic request validation, storing issues and their analysis in SQLite.
- Auto-classified each report into a category, priority (High/Medium/Low) and short summary using optional Gemini analysis with a deterministic local fallback, so the app works without any AI key.
- Deployed the frontend on Vercel and configured the backend for Render using environment-based API URL and CORS settings.

DocuParse Edge — Local-First AI Document Pipeline | GitHub

Python, Ollama, Llama 3 (8B), pypdf, OOP

- Built a fully offline, object-oriented pipeline that extracts text from PDFs and .txt files and generates structured insights with no data sent to the cloud.
- Implemented a routing engine that detects file type by extension and sends it to the matching extractor.
- Integrated a locally hosted Llama 3 model through the Ollama Python bridge, giving zero API latency and strict data privacy.

Log Security Analyzer — IEEE SYNAPSE 2026 Hackathon (6-hour build) | GitHub

JavaScript, browser-based

- Built a browser-only tool that parses an Apache/Nginx access log fully in the browser, so no log data leaves the user's machine.
- Detected failed logins, SQL injection and path traversal attempts, hacking-tool user agents and sensitive-file probes.
- Produced a 0–100 risk score per IP, an attack timeline chart, a top-attackers table and a copyable blocklist (.htaccess / iptables / plain IPs).

Education

B.Tech in Computer Engineering — AISSMS Institute of Information Technology, SPPU| 2029 | Second Year

Achievements & Activities

- Participant, IEEE SYNAPSE 2026 hackathon (6-hour offline build), October 2026
- Daily DSA practice in C++: DSA-Cpp-Tracker
